# Collect, Index, and Categorize at Scale

The verdict is in! ActiveNav can help you reduce your litigation costs and quickly respond to eDiscovery requests.
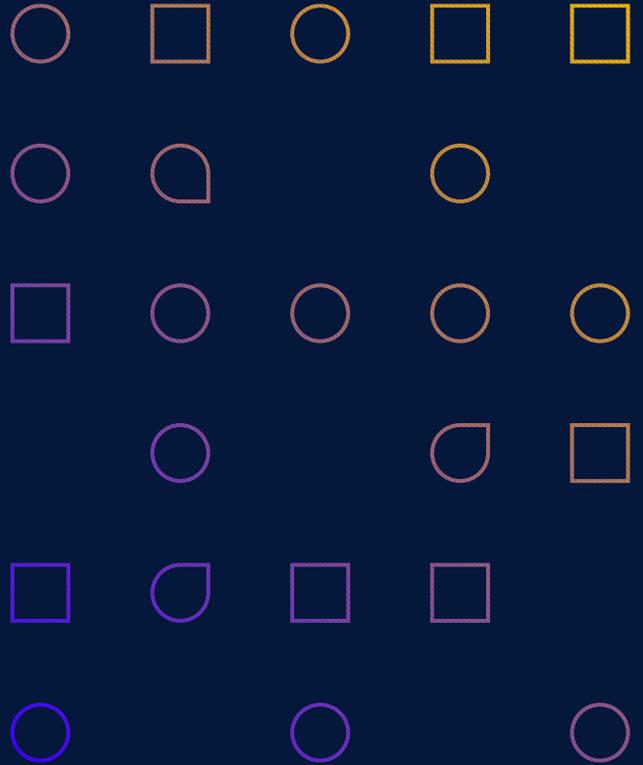

On-Premises, Agentless Software

The collection and processing of data for eDiscovery are increasingly expensive – especially as data volumes continue to grow. To complicate matters, nearly every organization is guilty of having too much data due to over-retention, meaning that companies often have terabytes and petabytes of electronically stored information (ESI) that could be relevant to litigation.

ActiveNav's battle-tested file analysis software scales faster and is more cost-effective than traditional eDiscovery solutions available today because we can:

- Reduce eDiscovery costs by pre-culling data at the time of collection with automated workflows and pre-configured analytics
- Leverage customizable rules to identify potentially relevant and privileged information
- Index up to 1 million files per hour for quick time-to-value, saving time and reducing cost

ActiveNav streamlines Early Case Assessment (ECA) by indexing and classifying unstructured data sets to identify potentially relevant data. By reducing the time to identify and collect, as well as reducing data volumes, your organization can realize cost savings from the beginning of an eDiscovery matter.

ACTIVENAV

Identify Potentially Relevant Data

ActiveNav can reduce eDiscovery costs by pre-culling data at the time of collection with automated workflows. Our software maps, identifies, and tags potentially relevant data and privileged information with a full audit trail-stack ranking the content that is most relevant and helping you meet tight deadlines.

Petabyte scale data discovery

ActiveNav's software is an on-premises deployment, meaning it can run locally, eliminating the need for a dedicated server. With a lightweight index size of 3 - 4%, you'll be up and running in no time.

Powerful classification rules

Find the needle(s) in the haystack. Out-of-the-box and extensive custom rules can identify potentially relevant and privileged information. Rules also facilitate CPRA, GDPR, and other regulatory compliance.

Discover relevant ESI across repositories

Discover and index content quickly, including network discovery. Search both metadata and content for potentially relevant files through search and filtering.

Defensible disposition and reporting

Workflows in ActiveNav are fully auditable. Confidently delete redundant, obsolete, and trivial (ROT) data that ads risk but no value. Intuitive dashboards integrate with Tableau and PowerBI for robust management reporting.

Reduce review costs by pre-culling data

Don't waste your money on pricey lawyers. Submit only relevant data to law firms for review, saving you time and money. Export files with end repository metadata and structure for a more accurate review.

On-going effective information governance

Manage legal risk by ensuring that the content collected meets your data retention policies. Identify data that provides no business value and apply appropriate actions such as archiving or deletion.
